

### Active Transport

- Using the diagram above, label a) sodium potassium pump, b) proton pump, and c) cotransport
- Define active transport.
- Why is ATP required for active transport?
- What would happen to the flow of molecules across a membrane if ATP was broken down?

- How do proton pumps contribute to membrane potential?
- Using the figure above, how is cotransport used to move sucrose across the membrane?
- Sodium potassium pumps are vital to neurons because they create a change in membrane potential. How do they accomplish this?

### Active Transport

In developing countries, contamination of food and water from cholera is a serious problem. Cholera is a disease caused by the bacterium *Vibrio cholerae*. Cholera causes severe diarrhea, which leads to the loss of large amounts of water per day. Cholera works by releasing a toxin that attaches to the lining of the digestive system. This causes the release of sodium and chlorine into the intestinal lumen (space inside intestines).

- Explain how the release of sodium and chlorine would lead to a loss of water in the intestines.
- In the intestinal cells there are sodium-glucose cotransporters. Knowing this, explain why doctors give patients recovering from cholera a sodium-glucose solution to drink.
