Strait, Bernard A. Schnauffer, Xiaohui Li, 2012-12-06 Although adaptive filtering and adaptive array processing began with research and development efforts in the late 1950s and early 1960s it was not until the publication of the pioneering books by Honig and Messerschmitt in 1984 and Widrow and Stearns in 1985 that the field of adaptive signal processing began to emerge as a distinct discipline in its own right. Since 1984 many new books have been published on adaptive signal processing which serve to define what we will refer to throughout this book as conventional adaptive signal processing. These books deal primarily with basic architectures and algorithms for adaptive filtering and adaptive array processing with many of them emphasizing practical applications. Most of the existing textbooks on adaptive signal processing focus on finite impulse response FIR filter structures that are trained with strategies based on steepest descent optimization or more precisely the least mean square LMS approximation to steepest descent. While literally hundreds of archival research papers have been published that deal with more advanced adaptive filtering concepts none of the current books attempt to treat these advanced concepts in a unified framework. The goal of this new book is to present a number of important but not so well known topics that currently exist scattered in the research literature. The book also documents some new results that have been conceived and developed through research conducted at the University of Illinois during the past five years.

Adaptive Signal Processing Bernard Widrow, Samuel D. Stearns, 1985 A comprehensive and practical treatment of adaptive signal processing featuring frequent use of examples. *Speech Processing and Synthesis Toolboxes* D. G. Childers, 1999-09-16 Strike a balance between theory and practice. With this text you will find a balance between theory and practice that allows you to build your understanding of the basic concepts, assumptions, and limitations of the theory of speech analysis and synthesis. The methods for data analysis as well as the theoretical background are provided to help you comprehend the analysis results. And you will be able to study the features and properties of speech as a signal without having to record data and write software to analyze the data. The text includes two CDs that contain stand alone and MATLAB software and speech and electroglottographic data. The CDs illustrate the effects that speech models and speech analysis procedures have on the quality of synthesized speech. An extensive speech database provides numerous speech files and other data. Examples included in each chapter demonstrate how to use the software. The CDs allow you to Calculate the parameters of linear prediction speech models. Examine procedures for converting the speech of one speaker to sound like that of another speaker i.e. voice conversion. Analyze and alter the temporal structure of the speech signal. This allows you to automatically parse speech into various features such as voiced segments, unvoiced segments, nasal and non nasal segments, fricatives, stops, and more. Create speech with a high speaking rate or generate speech with a slow speaking rate. Adjust the parameters of the vocal fold model to change the vocal fold tension, length, thickness, mass, etc. in order to observe the effects of these parameters on the vibratory motion of the vocal folds.
