

Calibration of Volumetric Glassware

In this laboratory exercise, we will calibrate the three types of glassware typically used by an analytical chemist; a volumetric flask, a volumetric pipet and a buret. Over the course of this semester, we will use these tools extensively when performing Gravimetric and Titrimetric Analyses. In order to avoid introducing Systematic Errors into our measurements, each of these instruments must be properly calibrated. And, to reduce the Random Errors inherent when using these instruments, their proper use must be thoroughly understood. The quality of the measurements obtained from these tools depends heavily on the care taken in calibrating and in using each instrument.

Pipettes (<http://www.chem.yorku.ca/courses/chem1000/equipment/pipette.html>)

Buret (http://en.wikipedia.org/wiki/File:Burette_vertical.png)

In precise work it is never safe to assume that the volume delivered by or contained in any volumetric instrument is exactly the amount indicated by the calibration mark. Instead, recalibration is usually performed by weighing the amount of water delivered by or contained in the volumetric apparatus. This mass is then converted to the desired volume using the tabulated density of Water:

$$\text{Volume} = \text{mass} / \text{density}$$
