A wave that moves up and down at a certain wave frequency.</p>	<h3>Wave Interactions</h3> <p>Read the passage carefully before answering the questions that follow.</p> <p>When two waves meet at a certain point, they can interact in different ways. They can combine to form a larger wave, or they can cancel each other out. This is called wave interference. There are two types of wave interference: constructive and destructive. Constructive interference occurs when two waves are in phase, meaning their crests and troughs are lined up together. This results in a wave with a larger amplitude. Destructive interference occurs when two waves are out of phase, meaning their crests and troughs are lined up together. This results in a wave with a smaller amplitude, or even no wave at all. There are also other types of wave interactions, such as reflection and refraction. Reflection occurs when a wave bounces off a surface, and refraction occurs when a wave changes direction as it passes through a medium. These interactions are all part of the complex world of wave physics.</p> <p>Understanding wave interactions is important for many applications, such as in the design of buildings and bridges. Engineers use their knowledge of wave interactions to ensure that structures can withstand the forces of wind and waves. They also use their knowledge of wave interactions to design better communication systems, such as radio and television. Wave interactions are also important in the study of sound and light. Sound waves interact with each other to create the rich tones of music, and light waves interact to create the colors of the rainbow. By studying wave interactions, we can better understand the world around us and the forces that shape it.</p> <p>Match the word with the appropriate definition to each question.</p> <p>46. A wave that moves up and down at a certain wave frequency.</p> <p>47. A wave that moves back and forth _____.</p> <p>48. A wave that moves up and down at a certain wave frequency.</p> <p>49.
