E. Leo Desautels, 2022-06-01 The presence of oriented features in images often conveys important information about the scene or the objects contained the analysis of oriented patterns is an important task in the general framework of image understanding As in many other applications of computer vision the general framework for the understanding of oriented features in images can be divided into low and high level analysis In the context of the study of oriented features low level analysis includes the detection of oriented features in images a measure of the local magnitude

and orientation of oriented features over the entire region of analysis in the image is called the orientation field High level analysis relates to the discovery of patterns in the orientation field usually by associating the structure perceived in the orientation field with a geometrical model This book presents an analysis of several important methods for the detection of oriented features in images and a discussion of the phase portrait method for high level analysis of orientation fields In order to illustrate the concepts developed throughout the book an application is presented of the phase portrait method to computer aided detection of architectural distortion in mammograms Table of Contents Detection of Oriented Features in Images Analysis of Oriented Patterns Using Phase Portraits Optimization Techniques Detection of Sites of Architectural Distortion in Mammograms
