Vandermeer, Deborah Esther Goldberg, 2003 How can the future number of deer agricultural pests or cod be calculated based on the present number of individuals and their age distribution How long will it take for a viral outbreak in a particular city to reach another city five hundred miles away In addressing such basic questions ecologists today are as likely to turn to complicated differential equations as to life histories a dramatic change from thirty years ago Population ecology is the mathematical backbone of ecology Here two leading experts provide the underlying quantitative concepts that all modern day ecologists need John Vandermeer and Deborah Goldberg show that populations are more than simply collections of individuals Complex variables such as the size distribution of individuals and allotted territory for expanding groups come into play when mathematical models are applied The authors build these models from the ground up from first principles using a much broader range of empirical examples from plants to animals from viruses to humans than do standard texts And they address several complicating issues such as age structured populations spatially distributed populations and metapopulations Beginning with a review of elementary principles the book goes on to consider theoretical issues involving life histories complications in the application of the core principles statistical descriptions of spatial aggregation of individuals and populations as well as population dynamic models incorporating spatial information and introductions to two species interactions Complemented by superb illustrations that further clarify the links between the mathematical models and biology Population Ecology is the most straightforward and authoritative overview of the field to date It will have broad appeal among undergraduates graduate students and practicing ecologists **Living in the Environment** George Tyler Miller, 2002 **Science Interactions** Robert W.
