Solar Energy Utilization Hafit Yüncü, E. Paykoc, Y. Yener, 2012-12-06 Until very recently energy supply of the world has been treated as being nearly inexhaustible Nowadays about 90 percent of the energy used is obtained from non renewable resources oil natural gas coal and uranium These resources are being used up at an alarming rate To meet our demands we are now searching for new sources of energy One of these new sources of energy is solar energy which will assume increasing importance It is free but means

must be developed to use it economically Research is actively under way to reduce the storage cost of this low intensity energy and for the design of economical systems The purpose of this Institute is to provide an international forum for the dissemination of information on solar energy utilization fundamentals and applications in industry This meeting is primarily a high level teaching activity The subject is treated in considerable depth by lecturers eminent in their field The other participants include scientists engineers and senior graduate students who themselves are involved in a similar research and who wish to learn more about current developments as well as scientists from other areas who are planning to research on solar energy The lectures are supplemented by informal discussions designed to encourage the free and critical exchange of ideas A limited number of contributions are also included This volume contains both basic and applied information contributed during the Institute The editors appreciate the cooperation of Martinus Nijhoff Publishes in making the proceedings widely available

Glocalized Solutions for Sustainability in Manufacturing Jürgen Hesselbach, Christoph Herrmann, 2011-03-19 The 18th CIRP International Conference on Life Cycle Engineering LCE 2011 continues a long tradition of scientific meetings focusing on the exchange of industrial and academic knowledge and experiences in life cycle assessment product development sustainable manufacturing and end of life management The theme Glocalized Solutions for Sustainability in Manufacturing addresses the need for engineers to develop solutions which have the potential to address global challenges by providing products services and processes taking into account local capabilities and constraints to achieve an economically socially and environmentally sustainable society in a global perspective Glocalized Solutions for Sustainability in Manufacturing do not only involve products or services that are changed for a local market by simple substitution or the omitting of functions Products and services need to be addressed that ensure a high standard of living everywhere Resources required for manufacturing and use of such products are limited and not evenly distributed in the world Locally available resources local capabilities as well as local constraints have to be drivers for product and process innovations with respect to the entire life cycle The 18th CIRP International Conference on Life Cycle Engineering LCE 2011 serves as a platform for the discussion of the resulting challenges and the collaborative development of new scientific ideas

Advances in Thermal Design of Heat Exchangers Eric M. Smith, 2005 The primary objective in any engineering design process has to be the elimination of uncertainties In thermal design of heat exchangers there are presently many stages in which assumptions in mathematical solution of the design problem are being made Accumulation of these assumptions may introduce variations in design The designer needs to understand where these inaccuracies may arise and strive to eliminate as many sources of error as possible by choosing design configurations that avoid such problems at source In this exciting text the author adopts a numerical approach to the thermal design of heat exchangers extending the theory of performance evaluation to the point where computer software may be written The first few chapters are intended to provide a development from undergraduate studies regarding the fundamentals of heat exchanger theory and the concepts of direct

sizing Later chapters on transient response of heat exchangers and on the related single blow method of obtaining experimental results should also interest the practicing engineer Theory is explained simply with the intention that readers can develop their own approach to the solution of particular problems This book is an indispensable reference text for higher level post graduate students and practicing engineers researchers and academics in the field of heat exchangers Includes a whole new chapter on exergy and pressure loss Provides in the first few chapters a development from undergraduate studies regarding the fundamentals of heat exchanger theory and continues in later chapters to discuss issues such as the transient response of heat exchangers and the related single blow method of obtaining experimental results that are also of interest to the practicing engineer Adopts a numerical approach to the thermal design of heat exchangers extending the theory of performance evaluation to the point where computer software may be written Contributes to the development of the direct sizing approach in thermal design of the exchanger surface Explains theory simply with the objective that the reader can develop their own approach to the solution of particular problems
