

Answer: The condition `evaluated to true!`

- 2) What would be the output of the code in #1 if `number` was originally initialized to 237?

Answer: The condition `evaluated to false!`

- 3) Write a multi-way `if-else` statement that evaluates a person's weight on the following criteria: A weight less than 115 pounds, output: `Eat 5 banana splits!` A weight between 116 pounds and 130 pounds, output: `Eat a banana split!` A weight between 131 pounds and 200 pounds, output: `Perfect!` A weight greater than 200 pounds, output: `Floody of banana splits have been consumed!`

Answer:

```
if (weight <= 115)
    System.out.println("Eat 5 banana splits!");
else if (weight <= 130)
    System.out.println("Eat a banana split!");
else if (weight <= 200)
    System.out.println("Perfect!");
else
    System.out.println("Floody of banana splits have been consumed!");
```

- 4) Name and describe three types of branching mechanisms and give an example of each.

Answer: Three types of branching mechanisms include the `if-else` statement, the multi-way `if-else` statement, and the `switch` statement. An `if-else` statement chooses between two alternative statements based on the value of a Boolean expression. If you only need to perform an action if a certain condition is true, then the `else` part of an `if-else` statement can be omitted. A multi-way `if-else` statement allows several conditions to be evaluated. The first condition that evaluates to true, is the branch that is executed. The `switch` statement is another multi-selection branching mechanism. A `switch` evaluates a controlling expression and executes the statements in the matching case label.
