1 DESCRIPTION

The QuickStart Serial driver allows the FieldServer to record data from Edwards System Technology QS1-2/4-8 and QSC Fire Panels over the RS-232 printer port. The FieldServer acts as a Passive Client receiving messages and updating its internal data arrays which records the status of devices connected to the QuickStart fire alarm control panel. The QuickStart panels currently do not support duplexed communications; therefore, this driver has only been designed to listen for messages passively and not to respond or to generate polls.

The main purpose of this driver is to record the status of Fire Alarm System points in bit oriented data arrays. It is limited by the information that the QuickStart control panels broadcasts in the form of text messages through its RS-232 printer port.

The types of EST messages supported by this driver are listed later in this fact sheet and in the FieldServer Driver Manual. Device status to the data array mapping is also provided. Since there are a variety of optional cards that can be selected for each QuickStart installation, each FieldServer application must be specifically configured before use. FieldServer data storage arrays for panel status will be allocated according to the number and type of cards implemented. Message information will also be stored according to card and panel addressing.

This driver is connection oriented; therefore, only one EST Panel may be connected to any single RS-232 FieldServer port.

The driver currently accommodates European and American English Conventional/Intelligent panels using the American English protocol with provisions for using the British English protocol at a later date.

1.1 FieldServer Synchronization

To synchronize the FieldServer's data arrays with the QuickStart control panel's status, the panel must have no active or disabled points on FieldServer startup. Alternatively, a panel can be hard/soft restarted to clear all point status, and then re-annunciate any active devices after the FieldServer has been started. This should only be undertaken by qualified technicians.

Should the panel be soft restarted unexpectedly, the FieldServer will recognize the "restart" command and clear all internal data arrays. There will be no need for FieldServer restart; however, for a hard restart, the FieldServer data arrays should be manually cleared by changing a bit in the CLEAR_FLAG data array through RUINET, then soft restarting the panel again to ensure that status of all points is re-annunciated and recorded by the FieldServer.

1.2 Device States

Each addressable device (real or pseudo) can have multiple states: alarm supervisory, monitor, other (security), and troubles. These states are not exclusive; therefore, a single addressable point may occupy multiple states at the same time.

Although there may be several trouble states for each device, there can only be a single alarm, supervisory, monitor and other (security) state per address. Therefore any restoring messages for these four states indicate that the device is clear of any active problems for these types of conditions.

However, there may be several trouble states for a single addressable port. These trouble states will be recorded in a separate trouble array of 2 byte elements. Each array element will correspond to a device address and each bit within the element will correspond to a trouble type. The mapping of message trouble types to element bit configuration is given below. For modeling simplicity and flexibility, it is assumed that all addressable points (real or pseudo) can exist in all states.
