<b>CONCEPTS AND SKILLS</b>	<p><b>The NPN transistor</b></p> <p>A transistor is a small semiconductor device with three legs, i.e., Base, Collector and Emitter. A transistor can be used as an electronic switch or as an amplifier, depending on how it is connected. A transistor is a <b>CURRENT CONTROL</b> device.</p> 	<p><b>Zener diode regulator</b></p> 

<p>The main current flow is between the collector and the emitter with the base being the 'controller'. By changing the voltage across the base, it is possible to change the current flow between the collector and the emitter. The base acts as an adjustable resistor to control the collector - emitter current.</p> <p><b>Construction of the NPN transistor</b></p>  <p>The NPN transistor is made up of two PN junctions connected back-to-back with the centre region the P region common to both.</p>	<p>The simplest regulator is a Zener diode connected directly across the supply leads of the power supply. It can maintain a constant voltage at the output, while being able to deliver a high level of current demand. To protect the Zener from damage by too large a current, it is coupled in series with a current limiting resistor <math>R_L</math>.</p> <p><b>Transistor voltage regulator</b></p> <p>A voltage regulator is a device or a circuit that is responsible for providing a steady DC voltage to an electronic load. In a transistor regulator, a transistor, Zener diode combination is used to provide the steady output voltage as can be seen in the circuit below. The transistor must be a power transistor to be able to handle large currents that might flow through it.</p> <p>Below is an example of a typical power transistor (NPN - TIP 31C)</p>  <p>In the circuit above, the Zener diode is used to provide a stable</p>
