

# **Antimicrobial Susceptibility Testing (AST) According to CLSI Guidelines**

## **Introduction:**

Antimicrobial susceptibility testing (AST) is a critical procedure in clinical microbiology for determining the efficacy of antibiotics against pathogenic microorganisms. The Clinical and Laboratory Standards Institute (CLSI) provides comprehensive guidelines to standardize these tests, ensuring reliability and reproducibility across laboratories. This document will cover the essential aspects of AST according to the CLSI guidelines, including the purpose, methodology, interpretation of results, quality control, and the specific antibiotics used against Gram-positive and Gram-negative bacteria.

## **Purpose of AST:**

The primary objective of AST is to guide clinicians in selecting the most effective antimicrobial therapy for patients with bacterial infections. This helps in:

- Predicting the success of antibiotic therapy.
- Controlling the spread of resistant strains.
- Informing local and global surveillance of antimicrobial resistance patterns.
- Supporting antibiotic stewardship programs.

## **Methodology:**

The CLSI outlines several methods for performing AST, including disk diffusion, broth microdilution, agar dilution, and automated systems. Each method has specific protocols and criteria for use.

### **1. Disk Diffusion Method (Kirby-Bauer Test):**

- **Preparation:** A standardized inoculum of the test organism is prepared, typically using the 0.5 McFarland turbidity standard.
- **Inoculation:** A Mueller-Hinton agar plate is uniformly inoculated with the bacterial suspension.
- **Application of Disks:** Antibiotic-impregnated disks are placed on the surface of the agar.
- **Incubation:** Plates are incubated at 35°C for 16-18 hours.
- **Interpretation:** The diameter of the inhibition zones around each disk is measured and compared to CLSI breakpoints to classify the organism as susceptible, intermediate, or resistant.

### **2. Broth Microdilution:**

already in 1945 bacteria have become resistant to antibiotics From time to time we are bombarded with news of infections  
and deaths caused by antibiotic resistant and multiple drug resistant superbugs This increase of resistance towards  
commonly used antibiotics due to decades of use misuse and abuse of antibiotics is today a global health concern Research  
investments on development of new antimicrobials that can fight antimicrobial resistant microorganisms are scarce yet some  
new antibiotic discoveries have been described recently Nevertheless the advent of antibiotic failure due to bacterial

**Innovation in Tackling the Global Challenge of Eradicating Antibiotic-Resistant Microorganisms** Israel Nissan, Fernando Reyes , Avi Peretz, 2026-02-03 The rise of antibiotic resistant microorganisms presents a formidable challenge to global health The World Health Organization WHO has identified antibiotic resistance as one of the top 10 global public health threats facing humanity <https://www.who.int/news-room/fact-sheets/detail/antimicrobial-resistance> In 2019 it was estimated that Antimicrobial Resistance AMR was associated with approximately 4.95 million deaths including 1.27 million deaths directly attributable to bacterial AMR The six leading pathogens for deaths associated with resistance were Escherichia coli Staphylococcus aureus Klebsiella pneumoniae Streptococcus pneumoniae Acinetobacter baumannii and Pseudomonas aeruginosa All these resistant pathogens are included in a 2017 WHO list for which new antibiotics are urgently needed <https://www.who.int/news/item/27-02-2017-who-publishes-list-of-bacteria-for-which-new-antibiotics-are-urgently-needed> From 2017 until 1 November 2021 only 12 new antibacterial drugs have been approved Over 80% 10/12 of the newly approved antibiotics belong to existing antibiotic classes where resistance mechanisms are already established <https://www.who.int/publications/i/item/9789240047655> AMR occurs when microorganisms such as bacteria fungi viruses and parasites evolve mechanisms to withstand the effects of antibiotics and other antimicrobials The World Bank estimated that in a high AMR impact scenario the annual global gross domestic product GDP will lose 3.8 percent of its annual GDP by 2050 with an annual shortfall of 3.4 trillion by 2030 The economic burden of antibiotic resistance is substantial with the attributable cost of resistant infection ranging from thousands to tens of thousands of US dollars per patient episode This not only strains healthcare systems but also poses a significant threat to our economies The economic toll of AMR encompasses various facets Firstly the escalation of resistant infections prolongs hospital stays necessitates more intensive treatments and escalates healthcare expenditures Furthermore the diminished efficacy of existing antibiotics undermines their value as essential tools in various medical procedures including surgeries organ transplants and cancer treatments thereby amplifying the risks associated with these interventions Moreover antibiotic resistance exacts a toll on productivity and economic growth Resistant infections impede workforce participation due to illness and disability leading to absenteeism and reduced productivity Additionally the burden of caring for individuals affected by resistant infections places strain on families and

communities further impeding economic development Beyond the dry statistics the AMR crisis causes significant human suffering for patients and their families This suffering is likely to be reduced through the development and application of new antibiotic treatments Regrettably the arsenal of antibiotic drugs particularly those employing novel mechanisms of action introduced in recent decades is extremely limited Traditional approaches to antibiotic development have often hit a wall failing to yield new antibiotics that can effectively combat resistant strains This necessitates a pivot towards innovative and groundbreaking strategies rooted in the latest technological advancements This call for papers is directed towards researchers engaged in the exploration of new antibiotics and or alternative treatments aimed at addressing the emergence of resistant microorganisms We welcome studies across various categories including but not limited to Fundamental research on novel mechanisms of action of antibiotics including those that can overcome known resistance mechanisms Clinical studies that evaluate the efficacy and safety of new antibiotics or alternative treatments Utilization of AI platforms for antibiotic discovery resistance prediction and personalized treatment strategies Bacteriophage therapy or phage derived enzymes Trojan horse based therapy and metal complexes with antimicrobial activity metalloantibiotics Microbiome modulating agents Immunomodulatory compounds New antibiotics from natural sources including microorganisms as a major source of most antibiotics in clinical use This call for scientific papers seeks to engage researchers across diverse disciplines in advancing our understanding of antibiotic resistance and exploring novel solutions to this pressing global threat In addition to fundamental research on the mechanisms of antibiotic action and resistance we encourage submissions that delve into clinical studies evaluating new therapeutic approaches the use of AI platforms for drug discovery and optimization We accept all article types listed in the Antimicrobials Resistance and Chemotherapy section Phage Biology section and Host and Microbe Associations section
