

6. Is a magnetic field real, or is it just a means of scientific modeling?

Field is real, field lines are modeled

7. Identify some magnetic forces around you. How could you demonstrate the effects of those forces?

Earth's magnetic field  
generator  
electric motor

refrigerator magnets  
Compasses

8. In your own words, describe the right-hand rule used to determine the direction of a magnetic field around a straight, current-carrying wire.

9. Imagine a toy containing two parallel, horizontal metal rods, one above the other. The top rod is free to move up and down.

a. Draw a picture of the setup.

b. The top rod floats above the lower one. If the top rod's direction is reversed, however, it falls down onto the lower rod. Explain why the rods could behave in this way.

Magnets

c. Assume that the top rod was lost and replaced with another rod. In this case, the top rod falls on top of the bottom rod no matter what its orientation is. What type of replacement must have been used?

non magnet

10. Draw a small bar magnet and show the magnetic field lines as they appear around the magnet. Use arrows to show the direction of the field lines.

11. Describe how to use the second right hand rule to determine the polarity of an electromagnet.

Wrap fingers around direction of current & thumb points north

12. Is the magnetic force that Earth exerts on a compass needle less than, equal to, or greater than the force that the compass needle exerts on Earth? Explain.

equal

**Students' Development of Models of Magnetic Materials, Patterns of Group Activity, and Social Norms in a Physics Classroom** Andrew P. Johnson, 1999 This dissertation is a study of students model development processes in a physical science course for preservice elementary teachers It details the models of magnetic materials developed and used by students during a unit on static electricity and magnetism In this inquiry based course the class developed and formally accepted a model in the form of diagrams and descriptions that is very similar to the accepted magnetic domains model They did this without textbooks or lectures on magnetism Before adopting this model however most groups in the class temporarily used models involving opposite charges at the two ends of magnetized nails How did the students do it The explanation involves detailed study of the groups interactions and use of structure in the classroom environment This dissertation uses two theoretical frameworks to analyze interactions It applies Yackel and Cobb s 1996

concepts of classroom social norms to characterize aspects of the classroom participation structure which affected groups construction and declaration of models It also applies distributed cognition ideas to analyze the sense making conversations that small groups had when constructing group responses This research found that conversations in one small group could be characterized into sixteen categories Important categories included extending ideas which involved gradual deepening and elaboration of the group s understanding of their model s and joint typing an interactive process by which group members collaborated on typed statements or group diagrams and simultaneously developed common language for communicating their ideas to each other Some of these categories of activity were closely connected to computer use Also four classroom norms are described One small group social classroom norm involved group members developing a common ground consisting of agreed upon group statements Three sociophysics norms which characterize the whole class interactions as well as those of the small group involved a distinction between generalizations of phenomena and theoretical statements class criteria for accepting evidence and the obligation for each group to have a model of magnetic materials that they could support with acceptable evidence
