Fluidware Franco Zambonelli, Giancarlo Fortino, Barbara Re, Mirko Viroli, 2024-07-12 This book provides an overview of the many approaches that can be adopted for programming and deploying highly adaptive and large scale IoT systems with a specific focus on the key results achieved within the Fluidware research project. The authors start by presenting Fluidware which develops a novel programming model for IoT services and applications along with the associated and robust large scale IoT services and applications. Starting from previous findings in the areas of field based coordination, collective adaptive systems, stream computing and aggregate computing, the authors address the complexity of building modern large scale IoT systems by a full fledged engineering approach revolving around a new notion of distributed programming. The authors show how the key innovative idea of Fluidware is to abstract collectives of devices of the IoT fabric as sources, digesters and targets of distributed flows of contextualized events carrying information about data produced and actuating commands. The book is divided into three parts: i) the first part is a general introduction to the Fluidware ideas and to the key problems associated with programming IoT systems; ii) the second part presents the key results achieved within the Fluidware project; iii) the third part identifies open challenges and research directions.
