

Nerve Impulse

- An impulse begins when a **neuron** is stimulated by the environment or by another neuron. It uses **Sodium** and **Potassium** ions to move the impulse (**action potential**)
- Impulse travels from the dendrites to the cell body and then along axons going away from the cell body until it reaches the end of an axon (**Axon Tip**)
- **Synapse** - The tiny space between the tip of one axon the tip of the next dendrite.
- When the impulse reaches the tip of the axon, packets of neurotransmitters (**acetylcholine**) are released into the synaptic gap.
- **receptors** on the adjacent dendrite receive the chemicals which starts a new impulse traveling.
