

3. Assemble jacks as shown in Figure 6. Check to make sure that the jacks have enough stroke to pull the hub off.

4. Working from inside with another worker, use approximately 100 PSI (6.9 MPa or 100 PSI) with working pressure, as shown in Figure 7. The temperature may be increased with a temperature gauge, heat blanket for three days in the hot month. Apply jacking pressure until the hub clears the shaft as shown in Figure 8.

LARGE SIZE COUPLINGS

Parts Identification

Refer to the appropriate Section (Lower) through to parts identification and maintenance information to supplement the manual.

Required Equipment

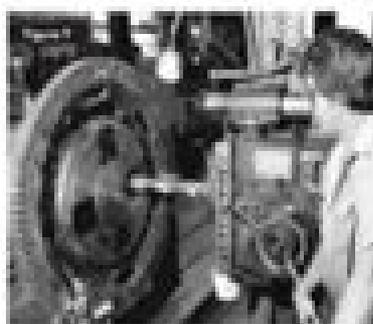

- A station or elevated roadway's side, for following a Manual;
- An hydraulic jacks having 50 ton minimum capacity with the required stroke, and a third piece or or similar pressure plate;
- An alloy steel plate of least 1" thick;
- Two chains of grade, diameter as 8 jacks holes in the hub and two chains 1/2 ton;
- Two wooden blocks;
- Metal shims;
- Heat resistant gloves;
- An air compressor;
- 100PSI. a. The alloy steel plates having and maximum permitted pressure should be determined by a qualified individual.

b. It is also recommended that the pump be equipped with a pressure gauge, so the user will know the amount of the pressure for a using.

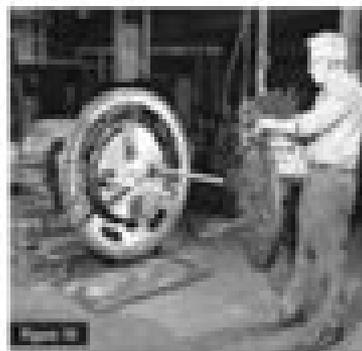

Procedure

The procedure for removing large size couplings, with a least one size 1" and a weight range over 4000Lb, is as follows:

1. Make sure driver's movement is fully limited out.
2. Make sure shims are laid from shaft and back for proper placement on front.
3. Disconnect the coupling and thoroughly clean hole of grease and solvent to make connections when time is needed.
4. In some cases, the key will have to be drilled out to facilitate hub removal, as shown in Figure 9.

4. Position the hydraulic jacks as shown in Figure 10.

5. For hubs without jacking holes, call and use two chains in the hub to secure the threaded nut bolts, Figure 12. Remove the alloy steel steel plate on the threaded nut bolts as shown in Figure 13. Refer to Table 1 for a listing of recommended jacking nut hole sizes.

7. Apply heat to the hub, using one or more radiant heaters, as shown in Figure 13. Heat should be applied evenly, and the hub reaches a temperature of 100° to 120° (38° to 50°C). Temperature sensors or paint can be used to indicate the hub temperature. Heat the outside of the hub first, then move slowly towards the shaft. As the tire is being done, start jacking pressure with the jacks. An action in doing this, with the temperature increasing on a large hub could take 10 to 20 minutes. A driver's working wheel will be heating the hub releases from the shaft. Continue the jacking action as needed until removal is complete, making sure the hub is securely supported by the shims.
