Translational Control of Gene Expression Nahum Sonenberg, John W. B. Hershey, Michael B. Mathews, 2000 Since the 1996 publication of *Translational Control* there has been fresh interest in protein synthesis and recognition of the key role of translation control mechanisms in regulating gene expression This new monograph updates and expands the scope of the earlier book but it also takes a fresh look at the field In a new format the first eight chapters provide broad overviews while each of the additional twenty eight has a focus on a research topic of more specific interest The result is a thoroughly up to date account of initiation elongation and termination of translation control mechanisms in development in response to extracellular stimuli and the effects on the translation machinery of virus infection and disease This book is essential reading for students entering the field and an invaluable resource for investigators of gene expression and its control

Regulation of Gene Expression Gary H. Perdew, Jack P. Vanden Heuvel, Jeffrey M. Peters, 2008-08-17 The use of molecular biology and biochemistry to study the regulation of gene expression has become a major feature of research in the biological sciences Many excellent books and reviews exist that examine the experimental methodology employed in specific areas of molecular biology and regulation of gene expression However we have noticed a lack of books especially textbooks that provide an overview of the rationale and general experimental approaches used to examine chemically or disease mediated alterations in gene expression in mammalian systems For example it has been difficult to find appropriate texts that examine specific experimental goals such as proving that an increased level of mRNA for a given gene is attributable to an increase in transcription rates

Regulation of Gene Expression Molecular Mechanisms is intended to serve as either a textbook for graduate students or as a basic reference for laboratory personnel Indeed we are using this book to teach a graduate level class at The Pennsylvania State University For more details about this class please visit <http://moltox.cas.psu.edu> and select Courses The goal for our work is to provide an overview of the various methods and approaches to characterize possible mechanisms of gene regulation Further we have attempted to provide a framework for students to develop an understanding of how to determine the various mechanisms that lead to altered activity of a specific protein within a cell

which results from the dramatic increase in interest in the control mechanism employed in gene expression and the importance of the regulated proteins presents new information not covered in *Translational Regulation of Gene Expression* which was published in 1987. It is not a revision of the earlier book but rather an extension of that volume with special emphasis on mechanism. As the reader will discover there is enormous diversity in the systems employing genes for translational regulation in order to regulate the appearance of the final product the protein. Thus we find that important proteins such as protooncogenes, growth factors, stress proteins, cytokines, lymphokines, iron storage and iron uptake proteins and a panorama of prokaryotic proteins as well as eukaryotic viral proteins are translationally regulated. Since for some gene products the degree of control is greater by a few orders of magnitude than their transcription we can state that for these genes at least the expression is translationally controlled. Translational regulation of gene expression in eukaryotes has emerged in the last few years as a major research field. The present book describes mechanisms of translational regulation in bacteria, yeast and eukaryotic viruses as well as in eukaryotic genes. In this book we try to provide in depth coverage by including important examples from each group rather than systematically including all additional systems not described in the previous volume.

Control of Gene Expression Mauro Carneiro, 1985

Control of Gene Expression by Cell Size Chia-Yung Wu, 2010

Polyploidy increased copy number of whole chromosome sets in the genome is a common cellular state in evolution, development and disease. Polyploidy enlarges cell size and alters gene expression producing novel phenotypes and functions. Although many polyploid cell types have been discovered it is not clear how polyploidy changes physiology. Specifically whether the enlarged cell size of polyploids causes differential gene regulation has not been investigated. In this thesis I present the evidence for a size sensing mechanism that alters gene expression in yeast. My results indicate a causal relationship between cell size and gene expression. Ploidy associated changes in the transcriptome therefore reflect transcriptional adjustment to a larger cell size. The causal and regulatory connection between cell size and transcription suggests that the physical features of a cell such as size and shape are a systematic factor in gene regulation. In addition cell size homeostasis may have a critical function maintenance of transcriptional homeostasis.

The motivation for us to produce a treatise on regulation was mainly our conviction that it would be fun and at the same time productive to approach the subject in a way that differs from that of other treatises. We had ourselves written reviews for various volumes over the years most of them bringing together all possible facts relevant to a particular operon, virus or biosynthetic system. And we were not convinced of the value of such reviews for anyone but the

expert in the field reviewed We thought it might be more interesting and more instructive for both author and reader to avoid reviewing topics that anyone scientist might work on but instead to review the various parts of what many different scientists work on Cutting across the traditional boundaries that have separated the subjects in past volumes on regulation is not an easy thing to do not because it is difficult to think of what interesting topics should replace the old ones but because it is difficult to find authors who possess sufficient breadth of knowledge and who are willing to write about areas outside those pursued in their own laboratories For example no one scientist works on suppression per se He may study the structure of suppressor tRNAs in Escherichia coli he may study phenotypic suppression of various characters in drosophila he may study polarity in gene expression and so on

Post-transcriptional Control of Gene Expression Celine Sin,2016 Gene expression describes the process of making functional gene products e g proteins or special RNAs from instructions encoded in the genetic information e g DNA This process is heavily regulated allowing cells to produce the appropriate gene products necessary for cell survival adapting production as necessary for different cell environments Gene expression is subject to regulation at several levels including transcription mRNA degradation translation and protein degradation When intact this system maintains cell homeostasis keeping the cell alive and adaptable to different environments Malfunction in the system can result in disease states and cell death In this dissertation we explore several aspects of gene expression control by analyzing data from biological experiments Most of the work following uses a common mathematical model framework based on Markov chain models to test hypotheses predict system dynamics or elucidate network topology Our work lies in the intersection between mathematics and biology
