the state of stress in the anchored wall monolith and its surrounding foundation The ANSYS FEM program was used primarily to take advantage of its nonlinear boundary element which was used to approximate the interaction at material interfaces Solutions for the various load cases were displayed graphically in numerous pressure stress and deflected shape diagrams Results confirm the assumption of the rigid body stability analysis program used to size the tendons of the anchored wall monolith and indicate a safe design with regard to the established criteria Author **Structures Under Extreme Loading Conditions, Fluid-structure Interaction, and Structural Mechanics Problems in Reactor Safety 1999** D.
