Engineers, 1987 This document is a revision and expansion of Technical Report No Daytime Lighting in Buildings The original document was published in 1962 by the Illuminating Engineering Society A revision was published in 1972 Since then attitudes towards the lighting of buildings have changed Some of the reasons for this are the considerable increase in the cost of energy and the recognition of the need to use it efficiently in the commercial sector particularly the use of computers has resulted in different approaches to the use of space within buildings The earlier document concerned itself mainly with design for daylight This new document while sharing this concern brings together in greater detail than before the other design factors which are influenced by daylight design decisions It is all too easy to design windows to provide daylight and at the same time create problems of unwanted noise intrusion glare summertime overheating and energy waste This guide provides designers with a means of identifying the important factors and a method of solving some of the design problems which will inevitably arise The reader's attention is drawn to the fact that in applying data and ideas from the different sections of the guide there will inevitably be a need to retain a balance between often conflicting requirements This document is intended to supplement the current range of CIBSE documentation and there is ample cross referencing The guide is divided into Part A Design sequence and Part B Design information The reference numbers throughout Part A and the supplementary numbers within the sectional reference lists in Part B refer to the Classified Bibliography on page 64 Part A guides the designer through the various stages of design and indicates the interaction between daylighting considerations and others It is cross referenced to Part B which provides more detailed guidance on prediction methods and basic data along with references to the relevant CIBSE publications The design information section is longer than the design sequence which it supports This is inevitable when alternative evaluation and prediction methods are provided It is not envisaged that a designer would ever work step by step through the whole design sequence For this reason Part A is set out in a three column format to enable the reader more easily to locate the particular material which interests him from the left hand column to read the relevant text in the centre column and to pick up the references from the right hand column Many aspects of window design may legitimately be based on experience or intuition rather than on formal analysis for example the use of splayed reveals the position of glazing bars and the use of the colour The role of the design sequence is to prompt the designer when he reaches an impasse and to offer a rational basis for decision making whenever necessary This publication refers to the design of conventional windows in the United Kingdom though it may also apply to other localities with a similar climate Some of the procedures presented are relatively new for example the concept of average daylight factor Although values of average daylight factor have been recommended it should be noted that experience of what the precise values imply in terms of daylight quality and quantity is limited and the recommendations may be changed in the light of experience On a similar note some of the techniques presented for designing conventional windows may not be totally reliable when applied to atrium design Therefore caution is urged when applying the content of the guide to anything other than

conventional fenestration In this content window covers vertical glazing in walls and glazing in sloping environments such as roofs Some aspects of window design are beyond the scope of this guide such as constructional methods or problems of strength or weather tightness Guidance on these aspects can be obtained from the window manufacturers *People of Today* ,2006
