Introduction to Genetics Terry A. Brown,2025-02-18 Nowadays genetics focuses on DNA Just like the first edition the theme of this new edition Introduction to Genetics A Molecular Approach is therefore the progression from molecules DNA and genes to processes gene expression and DNA replication to systems cells organisms and populations This progression reflects both the basic logic of life and the way in which modern biological research is structured The molecular approach is particularly suitable for students for whom genetics is part of a broader program in biology biochemistry the biomedical sciences or biotechnology This book presents the basic facts and concepts with enough depth of knowledge to stimulate students to move on to more advanced aspects of the subject This second edition has been thoroughly updated to cover new discoveries and developments in genetics from the last ten years There are new chapters that introduce important techniques such as DNA sequencing and gene editing and the applications of genetics in our modern world are covered in chapters describing topics as diverse as gene therapy and the use of ancient DNA to study prehistoric ecosystems

Key Features This book provides a molecular approach to the study of genetics It is a highly accessible and well structured book with chapters organized into four parts to aid navigation It presents high quality illustrations to elucidate the various concepts and mechanisms Each chapter ends with a Key Concepts section which serves to summarize the most essential points Self study questions enable the reader to assess their comprehension of chapter content and discussion topics facilitate a deeper understanding of the material by encouraging conversation and critical evaluation Key terms are emboldened throughout the text and are listed at the end of each chapter and definitions can be found in the Glossary For instructors who adopt the book an affiliated question bank is free to download

RECOMB 2003 Webb Miller,2003 We study haplotype reconstruction under the Mendelian law of inheritance and the minimum recombination principle on pedigree data We prove that the problem of finding a minimum recombinant haplotype configuration MRHC is in general NP hard This is the first complexity result concerning the problem to our knowledge An iterative algorithm based on blocks of consecutive resolved marker loci called block extension is proposed It is very efficient and can be used for large pedigrees with a large number of markers especially for those data sets requiring few recombinants or recombination events A polynomial time exact algorithm for haplotype reconstruction without recombinants is also presented This algorithm first identifies all the necessary constraints based on the Mendelian law and the zero recombinant assumption and represents them using a system of linear equations over the cyclic group Z_2 By using a simple method based on Gaussian elimination we could obtain all possible feasible haplotype configurations We have tested the block extension algorithm on simulated data generated on three pedigree structures The results show that the algorithm performs very well on both multi allelic and biallelic data especially when the number of recombinants is small Study Guide to Accompany Principles of Genetics, 3rd Edition D.
