**In-situ and In-operando Techniques for Material Characterizations during Battery Operation, 2nd edition** Veronica Palomares, Neeraj Sharma, 2023-06-07 Battery material research has been one of the major areas of study in the last 30 years due to the huge impact of battery technology in our daily lives Both the discovery of

new materials and their electrochemical optimization requires an in depth and fundamental understanding of the composition and structure at different length scales Local long range structure polymorphism microstructure composite formulation and nanoscale engineering all contribute to a materials innate ability to deliver the best performance as an electrode in a battery Importantly the evolution of all these components during battery function determine essentially all the pertinent battery characteristics such as lifetime and energy storage density For these reasons it is critical to determine materials structure at various length scales in order to be able to predict or understand their properties and propose changes to improve their electrochemical behavior In this sense conventional characterization techniques of the material itself are very useful in the first stages of research but in many cases the use of in situ or in operando characterization techniques provides a unique way of understanding materials performance or evolution during battery operation The challenge becomes greater in terms of experimental design because these techniques involve devising and fabricating specific electrochemical cells that fulfill the requirements of the technique but deliver electrochemical performance akin to a real life device

**Approaching human intelligence through chemical systems: Development of unconventional chemical artificial intelligence** Pier Luigi Gentili,Konrad Szaciłowski,Andrew Adamatzky,2023-11-27 Although human intelligence is deeply investigated by neuroscientists psychologists philosophers and AI researchers we still

lack of a widely accepted definition of what it is. If we exploit the emergence theory from Complexity Science to give a definition, we might state that human intelligence is the emergent property of the human nervous system. Such fascinating emergent property allows us to handle both accurate and vague information by computing with numbers and words. Moreover, it allows us to reason, speak, and take rational decisions in an environment of uncertainty, partiality, and relativity of truth when the Incompatibility Principle holds. As the complexity of a system increases, accuracy and significance become almost mutually exclusive characteristics of our statements. Finally, our intelligence allows us to recognize quite easily variable patterns. Therefore, it is worthwhile investigating human intelligence and trying to mimic it by developing Artificial Intelligence. Nowadays, Artificial Intelligence is in vogue; it is applied in both basic and applied science. Traditionally, there are two strategies to develop Artificial Intelligence. A strategy consists in writing human-like intelligent software running on von Neumann computers or special purpose hardware. The other strategy consists in neuromorphic engineering. Neuromorphic engineering implements surrogates of neurons through non-biological systems, either for neuro-prosthesis or to design brain-like computing machines. A third strategy is now blooming, and it consists in using molecular/supramolecular materials and systems chemistry to mimic some basic functions of human intelligence, such as Boolean multi-valued logic gates and Fuzzy logic. This third strategy is originating Chemical Artificial Intelligence (CAI). A relevant purpose of CAI is to design modules for Chemical Robots. A Chemical Robot is thought of as a molecular assembly that reacts autonomously to its environment by probing it with molecular sensors, making decisions by its intrinsic Artificial Neural Networks or logic gates, and performing actions upon its environment through molecular effectors. The intelligent activities of any Chemical Robot should be sustained energetically by a metabolic unit. Chemical Robots should be easily miniaturized and implanted in living beings to interplay with cells or organelles for biomedical applications. They should become auxiliary elements of the natural immune system.
