## **COMPUTER VISION: IMAGE RECOGNITION**

**AND ANALYSIS TECHNIQUES** Prof. Munindra Lunagaria,Mr. Yogesh Kumar Podapati,Dr. Sheshang D.

Degadwala,Saikumar Tara,2023-07-04 Computer vision is what we call the practice of using computer based imaging where there is no human interaction in the visual loop at any point in the process The photos are analyzed by a computer which then takes appropriate action depending on their results Computer vision systems are used in a variety of medical disciplines and the only thing that can be said with absolute confidence is that the scope of these systems applications will continue to expand in the future is the only thing that can be declared with absolute certainty processing one or more digital photographs in order to generate valuable inferences about real world physical objects and situations by computing the features of the 3D environment This processing may be done with either one picture or all of them together generating an accurate and comprehensive description of a real world object based on a photograph of that thing The discipline of computer vision came into being as a consequence of efforts to model image processing utilizing the several approaches that are accessible within the discipline of machine learning The field of computer vision makes use of machine learning to search for patterns in images with the end goal of deciphering such patterns The field of computer vision entails the practice of teaching computers to recognize objects based on the digital still photos or moving movies that are sent into them Finding methods through which jobs can be automated that now rely on the human visual system is the objective here Image processing is one of the various methods that are utilized in the execution of this approach The subfield of artificial intelligence AI known as computer vision is an absolutely necessary component in order for computers and other types of systems to be able to respond or provide suggestions based on visual data such as digital photos movies and other types of inputs The same way that artificial intelligence makes it possible for computers to think computer vision makes it possible for computers to see comprehend and observe Computer vision and human vision are functionally comparable the primary difference is that human eyesight developed far earlier than computer vision The capacity of human beings to learn to differentiate between different things their distances from one another whether or not the items are moving

Simkin,1987-04 **DEEP LEARNING ARCHITECTURES - NEURAL NETWORKS AND DEEP LEARNING MODELS** Dr. Rachit Adhvaryu,Md Aminul Islam,Dr. Kishore Kumar M,Vibhor Kumar Vishnoi,2024-05-14 Computers that can mimic human environment to the point that they display signs of intelligence as we

define it have been the subject of intense study for almost fifty years This can only happen if there is a large amount of knowledge about our environment stored in the computer either consciously or unconsciously Many academics have relied on learning algorithms to collect much of this data since formalizing all of it in a way that computers can use to answer questions and generalize seems to be a lengthy procedure The extensive usage of learning algorithms and the recognition of their efficacy have not resolved the significant challenges that artificial intelligence AI still faces Would it be possible to build an algorithm that could understand scenes and describe them in plain English if the technology existed Absolutely not in the majority of cases in fact it would only work in very specific cases Popular and reasonable methods for obtaining relevant information from natural images include gradually abstracting them from their basic pixel representation This may be done in stages starting with edge detection moving on to more complex yet localized shapes and finally identifying abstract categories associated to sub objects and objects in the image Then when we put them all together we ll have a good enough understanding of the situation to answer questions about it Even if it s challenging enough to build reasonable intermediate abstractions it would be ideal if a smart computer could understand a broad range of visual and semantic categories By starting with the most basic building blocks and working its way up to the most advanced ideas deep architecture learning aims to automatically uncover these abstractions Imagine the amount of progress that might be achieved if learning algorithms could facilitate this finding with little human intervention Therefore it is not required to define all of the required abstractions or to maintain a huge database of relevant examples that have been hand labeled Such algorithms may let machines understand a large chunk of human IP if computers could access the vast amounts of text and images available on the internet
