Implementing Network Security

In the case of the SQL Slammer worm, malicious traffic was detected on UDP port 1434. This port should normally be blocked by a firewall on the perimeter. However, most infections enter through back doors and do not pass through the firewall. Therefore, to prevent the spreading of this worm it would be necessary to block this port on all devices throughout the internetwork.

In some cases, the port on which the worm is spreading might be critical to business operations. For example, when SQL Slammer was propagating, some organizations could not block UDP port 1434 because it was required to access the SQL Server to legitimate business transactions. In such a situation, alternative methods considered.

If the network devices using the service on the affected port are shown permitting remote access to an application. For example, if only a small number of clients are using SQL Server, one option is to open UDP port 1434 to external devices only. Specific access is not guaranteed to solve the problem, but it certainly lowers the probability of infection.
