Mathematical Modeling of Complex Biological Systems
Abdelghani Bellouquid, Marcello Delitala, 2007-10-10 Contents and Scientific Aims The scientific community is aware that the great scientific revolution of this century will be the mathematical formalization by methods of applied mathematics of complex biological systems. A fascinating prospect is that biological sciences will finally be supported by rigorous investigation methods and tools similar to what happened in the past two centuries in the case of mechanical and physical sciences. It is not an easy task considering that new mathematical methods may be needed to deal with the inner complexity of biological systems which exhibit features and behaviors very different from those

of inert matter Microscopic entities in biology say cells in a multicellular system are characterized by biological functions and the ability to organize their dynamics and interactions with other cells Indeed cells organize their dynamics according to the above functions while classical particles follow deterministic laws of Newtonian mechanics Cells have a life according to a cell cycle which ends up with a programmed death The dialogue among cells can modify their behavior The activity of cells includes proliferation and or destructive events which may in some cases result in dangerously reproductive events Finally a cellular system may move far from eq librium in physical situations where classical particles generally show a tendency toward equilibrium An additional source of complexity is that biological systems always need a multiscale approach Specically the dynamics of a cell including its life are ruled by sub cellular entities while most of the phenomena can be e ectively observed only at the macroscopic scale
